EXECUTIVE SUMMARY

Second year B.Tech in Data Science and AI at **IIIT Dharwad**, with strong foundation in data structure and algorithms, object - oriented programming (in Python, C++) . I have built real-world AI projects, including **Flashcard and short notes making AI , AI bug Reproduction Engine** and completed a 3 - months data science internship working with stakeholders on live industry projects . Comfortable working in team settings, participating in project discussions. I am eager to improve my skills and contribute to projects at company to contribute to software development tasks, support debugging and testing efforts. I would love to be part of your innovative journey and believe I can add meaningful value to your team.

TECHNICAL SKILLS

Programming Languages	Python, Typescript, Javascript, SQL, JSON, C++ , HTML, CSS , React
Core CS Fundamentals	Data Structures & Algorithms, Object-Oriented, REST API's, Unit testing, Programming, System Design ,Machine Learning
AI/ML	Scikit-learn, PyTorch, NLP, LLMs, RAG
Databases	DBMS, MySQL, SQLite
Tools & Platforms	Git, VS Code, Jupyter Notebook, Tableau, Power BI, Linux, FastAPI, Pytest
Soft Skills	Statistics, Data Analysis, Machine Learning, Predictive Analytics
Data & Analytics	Solving, Team Collaboration, Debugging, Documentation & Reporting, Communication

EDUCATION

Indian Institute of Information Technology Dharwad (IIIT - DWD)

Aug 2025 - May 2029

B.Tech in Data Science and Artificial Intelligence

- Relevant coursework: Data Structures & Algorithms, Machine Learning, Artificial Intelligence, Database Systems, Operating Systems, Computer Networks .
- Pursuing advanced modules in deep learning and large-scale system design aligned with

EXPERIENCE

Data Science Intern - [AmericanEagle.com-Certificate](#)

Apr 2026 – Jul 2026 (3 Months)

- Applied **Python, Excel, SQL, and statistical analysis** to process and analyse large datasets for business insights.
- Conducted **EDA, feature engineering, and data preprocessing** to enhance model performance.
- Implemented **machine learning models** for predictive analytics and decision-making support.
- Designed **Tableau dashboards , PowerBI(Basic)** to visualise KPIs and trends for stakeholders.
- Contributed to **live industry projects**, improving analytical, teamwork, and problem-solving skills.

PROJECTS - These Projects consists both frontend and backend.

NeuroLearn AI - [github/NeuroLearn-AI](https://github.com/NeuroLearn-AI)

Python, FastAPI, React, PyTorch, Hugging Face, LLM(local source), PostgreSQL

- Developed a local-first AI learning platform that transforms PDFs, lecture slides, and study materials into structured notes, flashcards, and adaptive quizzes using multiple ML models and local LLM integration
- Engineered an NLP pipeline incorporating keyword extraction (KeyBERT/TF-IDF), semantic embeddings (Sentence Transformers), topic classification, and K-Means clustering for intelligent document understanding
- Implemented evidence-grounded content generation with semantic retrieval, cross-encoder reranking, and source-page citation to verify generated answers against original documents
- Built a model evaluation framework comparing local LLMs (Gemma) on content quality, factual support, generation latency, and resource consumption with measurable benchmarks (Recall@5: 1.0, MRR: 1.0)
- Designed a personalised revision engine using SM-2 spaced repetition algorithm, quiz analytics, and topic-level performance tracking with 12,000+ lines of production code

AI Bug Reproduction Engine - [github/Al_bug_reproduction](https://github.com/Al_bug_reproduction)

Python | FastAPI | Py-test | Docker |
Claude API | Threading | JSON | Git

- Built an AI tool that converts a natural-language bug report and a Python repository into a runnable Py-test reproduction test, with a clear verdict: Reproduced, Not Reproduced or Inconclusive.
- Developed a six-stage pipeline (analyse, locate code, generate test, execute, verify, report) with a FastAPI backend, CLI and web dashboard, using Claude to generate and self-repair tests.
- Ran untrusted code in locked-down Docker containers (no network, read-only filesystem, CPU, memory and time limits) and repeated each test to detect intermittent failures.
- Verified fixes by rerunning the same test on corrected code, reproducing a seeded race-condition bug (duplicate checkout) with no false positives on the benchmark, backed by automated test.
- JSON for report analysis, test generation and failure-matching, with an offline fallback so the tool still runs without an API key.
- Added a self-repair loop that feeds test errors back to the model, and a judge step that downgrades a result to Inconclusive when the failure doesn't match the original report
